

Bhasha Health

AI clinical documentation assistant for Indian hospitals, supporting regional languages (Hindi, Tamil, Bengali, Marathi).

Raising 12,000,000 INR (~\$145,000) pre-seed.

Founder: Dr. Ananya Rao (practicing physician, Bangalore).

The Problem

Indian doctors in public and semi-private hospitals spend an estimated 90 minutes per day on manual clinical note-taking, in a system where most patient conversations happen in regional languages rather than English.

Our Product

An ambient AI scribe that listens to doctor-patient conversations in regional Indian languages and produces structured clinical notes in English and the local language, integrated with common Indian hospital management systems.

Traction

3 hospital pilot sites in Bangalore and Chennai (2 private, 1 public).

Approximately 40 doctors using the tool daily across pilots.

Self-reported time savings of ~35 minutes/day per doctor in early pilot feedback (not yet independently measured).

Market

India has roughly 1.3 million registered allopathic doctors. Clinical documentation tooling for the Indian regional-language context is largely unaddressed by existing (English-first, US-built) ambient scribe products.

Team

Dr. Ananya Rao - 8 years practicing physician, public hospital experience in Bangalore, self-taught the initial prototype.

Team of 3, all Bangalore, no prior startup experience.

The Ask

Raising 12,000,000 INR pre-seed to expand to 10 hospital sites and hire 2 engineers.
